Bengaluru, Karnataka | B.E. Electronics and Communication, NMIT | 2026 graduate

SUMMARY

2026 Electronics and Communication graduate seeking an entry-level QA / Software Test Engineer role. I find where software breaks before users do: I design test cases (boundary values, equivalence classes, state transitions), automate API, database and browser checks with pytest and Playwright, and write bug reports anyone can reproduce. Built a 144-test suite for a live order and UPI payment app that catches all 8 bugs I planted in it; wrote unit and integration tests during a three-month Java Spring Boot internship.

TECHNICAL SKILLS

Testing: test plans and test cases, boundary value analysis, equivalence partitioning, state-transition testing, functional and regression testing, data-quality testing, testing AI output (accuracy sets, prompt injection), bug reports, traceability
Automation: Python, pytest (fixtures, parametrization), Playwright for browser tests, requests for API tests, GitHub Actions
API and data: REST API testing, status codes and error cases, SQL validation queries and data invariants (SQLite, PostgreSQL)
Programming: Python, Java, SQL, JavaScript, TypeScript
Tools: Git, GitHub, VS Code, Render

PROJECTS

Orderdesk QA Suite | Python, pytest, Playwright, requests, SQL, FastAPI, GitHub Actions
orderdesk-qa-suite-live.onrender.com | github.com/Anubhavkumarkanth/orderdesk-qa-suite

- A test suite that catches the payment bugs that cost a shop money or customers: double charges, refunds that never happen, stock oversold in a sale, payments stuck as pending. The app it tests is a small order and UPI checkout I built, live on Render.
- Wrote the requirements, test plan, 73 test cases (144 automated tests: 113 API, 8 database, 21 browser, 2 simulator) and a traceability matrix that links every test to a requirement.
- Covered the edges where bugs hide: quantities 0/1/10/11, coupon minimums at 499.99/500.00/500.01, order-status changes that must be refused, one-paisa rounding, and 500 buyers racing for the last 5 units.
- Simulated real UPI failures with NPCI's error codes (wrong PIN, low balance, bank timeout) at real decline rates (9.62% customer-side, 0.29% bank-side), plus repeated or forged payment messages, failed refunds and a phone on 3G that double-taps Pay or loses signal.
- Planted 8 bugs and showed the suite catches every one, with a reproducible bug report for each; broke the code 34 more ways and the matching test failed each time. CI blocks any change that fails. I wrote both the app and the tests, so this shows how sensitive the tests are.

UPI Pulse: Data and AI Testing | Python, pytest, DuckDB, GitHub Actions
anubhavkumarkanth.github.io/upi-pulse | github.com/Anubhavkumarkanth/upi-pulse

- Makes sure a public data site and its AI features can be trusted: bad source data must not reach the site, and the AI must not make up numbers or follow an attacker's instructions.
- Wrote 50 data checks that run before every update (ranges, totals adding to 100%, one row per bank per month); they caught a real error in NPCI's published figures (August 2022 rates missing the decimal point).
- Tested the AI question box: 30 of 30 right on questions with known answers, and a model that obeys "ignore your rules" gets nothing through. Found and closed a gap that let a made-up number pass as data.
- Attacked the live AI with 16 questions: it refused all 8 attacks, and the 2 out-of-scope questions it answered are recorded as failures, not hidden.

SIP Friction Analyzer | Python, FastAPI, PostgreSQL, pytest
github.com/Anubhavkumarkanth/sip-friction-analyzer

- Shows people who invest every month (SIPs) what skipping or cutting a payment costs them by the end of the plan. Tested sign-in, saving a run in one transaction and cascading deletes with pytest, and checked the maths by hand: skipping month 2 of a 5,000-a-month plan at 12% leaves 5,578 less after a year, matching the app.

EXPERIENCE

Full Stack Development Intern | Redevelopers Automate Solution Pvt. Ltd. | Feb 2026 - Apr 2026

- Identified and resolved software defects; wrote unit and integration tests to improve application reliability.
- Developed RESTful backend APIs in Java Spring Boot; designed relational database components using SQL and NoSQL technologies.

EDUCATION

Bachelor of Engineering (B.E.), Electronics and Communication Engineering
Nitte Meenakshi Institute of Technology (NMIT), Bengaluru | Aug 2022 - Aug 2026

CERTIFICATIONS

Kaggle: Intro to SQL and Advanced SQL | 2026
Career Essentials in Data Analysis | Microsoft & LinkedIn (Power BI, Python, Excel, PostgreSQL) | 2026
