Bengaluru, Karnataka · B.E. Electronics & Communication, NMIT · 2026 graduate · anubhav-kumar.vercel.app

SUMMARY

2026 Electronics and Communication graduate who works through data problems in Python and SQL. Built a pandas pipeline on public CDC survey data, found that an inherited model's training labels were just a formula, and tested a replacement against simple baselines on held-out data, reporting where it was no better. Kaggle-certified in Intro and Advanced SQL; completed Microsoft & LinkedIn's Data Analysis Career Essentials. Seeking an entry-level data analyst role.

EDUCATION

Bachelor of Engineering (B.E.), Electronics and Communication Engineering | Sep 2022 – Aug 2026
Nitte Meenakshi Institute of Technology (NMIT), Bengaluru

TECHNICAL SKILLS

Analysis: Python, pandas, NumPy, data cleaning and joins, exploratory analysis, data-quality checks, regression, scikit-learn (train/validation/test splits, baselines, MAE, R^2)
SQL: PostgreSQL; joins, GROUP BY and COUNT(DISTINCT), CTEs, window functions; indexes and query-plan analysis
Excel & BI: Excel; Power BI (Microsoft & LinkedIn course)
Other: Streamlit, FastAPI, Recharts, pytest, Git, GitHub; Java (Spring Boot, from the internship)

PROJECTS

Dietbot: Calorie-Intake Prediction on NHANES Data | Python, pandas, NumPy, scikit-learn, PostgreSQL | GitHub

- A calorie-intake model for athletes that I rebuilt from an inherited notebook prototype. Its training data turned out to be a formula (every macro value a fixed multiple of calories, correlation above 0.999 over 99 rows), so the old model could only relearn that formula.
- Built a repeatable data pipeline: a script downloads three public CDC survey files (NHANES 2017–2018), joins them on respondent ID with pandas, keeps adults aged 18–80 with intake between 800 and 5,000 kcal, and writes a clean dataset of 4,624 people.
- Tested four designs against baselines on a 60/20/20 train, validation and test split, tuning on the validation set only. For daily calorie intake, average error on held-out people was 684 kcal for a plain average, 651 for the Mifflin-St Jeor calorie formula, 632 for linear regression and 633 for a Random Forest: the forest was no better than linear regression.
- Documented the limits: one day of recalled intake is noisy (R^2 0.13, standard deviation about 855 kcal), the survey weights were not used, and what people eat is not what they need.

SIP Friction Analyzer: Investment Simulator | Python, SQL, PostgreSQL, FastAPI, React | GitHub

- A web app that shows what skipped or reduced contributions to a monthly investment plan (SIP) cost. Defined three measures (share of planned contributions paid, value lost to missed compounding, a 0–100 discipline score) with year-by-year planned-versus-actual charts. Checked by hand: 5,000 a month at 12% for a year with month 2 skipped loses 5,578 (score 91.4), matching the app.
- Wrote a Monte Carlo simulation of 1,000 random return paths that reports the 10th, 50th and 90th percentile outcomes, scaling annual volatility to monthly by dividing by $\sqrt{12}$.
- Wrote the SQL behind a per-user report of which kind of skipped or reduced contribution costs most: it joins events to runs, groups by event type, counts distinct runs, averages the loss and labels its size with a CASE band.
- Added an index for the per-user history lookup and measured it on 20,000 generated rows: the isolated query dropped from about 0.8 ms to 0.06 ms, but the full history endpoint, which also joins events, improved only about 1.3 to 1.4 times (3.8 ms to 2.8 ms).

EXPERIENCE

Full Stack Development Intern | Redevelopers Automate Solution Pvt. Ltd. | Feb 2026 – Apr 2026

- Developed RESTful backend APIs in Java Spring Boot.
- Designed and managed relational database components using SQL and NoSQL technologies for application data persistence.
- Identified and resolved software defects; wrote unit and integration tests to improve application reliability.

CERTIFICATIONS

Kaggle: Intro to SQL and Advanced SQL | 2026
Career Essentials in Data Analysis | Microsoft & LinkedIn (Power BI, Python, Excel, PostgreSQL) | 2026

LEADERSHIP

- Design Team Lead, ASE Club: organised I-Solve, a national-level hackathon with Bangalore Traffic Police (100+ participants).
